

The Genecept Assay Physician Approval Form

The Genecept Assay is a comprehensive saliva-based genetic test that helps guide treatment decisions and increases treatment response for patients with psychiatric disorders.

The Genecept Assay looks at key genes in your body that affect how it responds to medications. It includes pharmacodynamic genes so that treatment decisions can be personalized to the individual. These genes analyzed are associated with a wide range of psychotropic medications and can help inform treatment plans for depression, anxiety, OCD, ADHD, bipolar, PTSD, schizophrenia, chronic pain, and substance abuse.

This assay looks at genetic changes that give a predisposition to metabolism changes for medications processed through the CP450 pathways. It can be helpful when starting patients on psychiatric medications or making changes to current regimens. At Innersource, we are able to perform this test and get the results back to the treating clinical provider.

If you feel your patient would benefit from this assay we will schedule a testing date at InnerSource in Annapolis, MD.

After the results are complete, we will forward a copy of the test to your office.

Patient Name (please print): _____

Physician Name: _____ Signature: _____

Office address: _____
